

CALY

High-level mockup

What you are making

Five phone-proportion screens show the main Caly journey. The visual direction is calm and note-first: warm paper background, plain readable type, Breakfast/Lunch/Dinner sections, food and calories aligned like a note, and a restrained gold accent for actions and selection. The interface does not label the technology behind the calorie result.

Step A: Set up your frame

Each mockup uses an approximately 390 × 844 phone proportion with a status bar, comfortable 24 px content margins, and a consistent three-item bottom navigation on the signed-in main screens.

Step B: Draw the screens

1. Sign In / Registration

What the user does here: The user signs in to an existing account or opens the create-account path. After successful sign-in, the app opens Today's Food Note.

Tappable paths: Sign in → Today's Food Note. Create an account → registration flow, then Today's Food Note.

2. Today's Food Note

What the user does here: Breakfast, Lunch, and Dinner each have their own Add food line. The user taps Add food under the meal they want, types one food, sees its calorie value appear on the right, and sees the daily total recalculate after each result.

Tappable paths: Add food under Breakfast / Lunch / Dinner → create an editable row in that meal section. Tap a calorie → Food Correction. History → Food History. Settings → Settings.

3. Food Correction

What the user does here: The user corrects one food entry without leaving the context of the journal. The sheet focuses only on food name, quantity, serving, calories, and the save action.

The image shows a mobile app interface for a food journal. At the top, a status bar displays the time 9:41, signal strength, and battery level. Below this, a header section for 'Today' (Sunday, September 20) lists a breakfast entry: '1 cup rice' with '200 kcal'. A horizontal line separates this from the 'Edit food' screen below. The 'Edit food' screen has a title 'Edit food' and a subtitle 'Food'. It contains four input fields: 'Food' (with '1 cup rice' entered), 'Food name' (with 'White rice, cooked' entered), 'Quantity' (with '1' entered), and 'Serving' (with 'cup' and a right arrow entered). Below these is a 'Calories' field showing '200 kcal' and a link 'Edit manually'. At the bottom are two buttons: a large orange 'Save changes' button and a smaller grey 'Cancel' button.

Save changes

Cancel

Tappable paths: Save changes → Today with the new calorie value and recalculated total. Cancel / drag down → Today without changes.

4. Food History

What the user does here: The user scans or searches previous daily notes and reopens a saved day.

Food History

 Search food or date

SEPTEMBER 2026

Today · Sun, Sep 20 1,455 kcal

Rice, eggs, chicken adobo, banana

Sat, Sep 19 1,780 kcal

Oatmeal, chicken sandwich, milk

Fri, Sep 18 1,910 kcal

Pandesal, tuna, rice, coffee

Thu, Sep 17 1,640 kcal

Eggs, rice, sinigang, fruit

Wed, Sep 16 1,720 kcal

Banana, pancit, coffee, tilapia

Tap a day to reopen its note.

Today

History

Settings

Tappable paths: Tap a saved day → Today on that date. Today / Settings → those main screens. Search → filters the list.

5. Settings

What the user does here: The user changes the daily calorie goal and appearance, reviews the signed-in account, clears journal data, or signs out.

Tappable paths: Daily calorie goal / Appearance → edit control. Clear food journal → confirmation. Sign out → Sign In / Registration.

Main journey: Sign In / Registration → Today's Food Note → tap a calorie → Food Correction → Save → Today. From Today, bottom navigation opens Food History and Settings. Signing out from Settings returns to Sign In / Registration.

What changed, and why

Screen or element	The wireframe assumed	The mockup shows	What I will change
Main journey	The initial wireframe included Sign In, Today, Correction, History, Insights, and Settings.	The mockup uses Sign In, Today, Correction, History, and Settings.	Insights is moved to stretch so the main journey stays focused and buildable.
Today's Food Note	The wireframe showed meal headings, food rows, editable Add food lines, and recognition/status areas.	The mockup keeps a separate Add food line under Breakfast, Lunch, and Dinner. Food stays on the left, calories on the right, and the total stays at the bottom.	The user decides the meal by where they tap Add food. This is simpler than automatic meal classification and keeps the note behavior predictable.
Food Correction	The wireframe included extra recognition details and alternative-match controls.	The sheet contains food, quantity, serving, calories, Save, and Cancel.	Only controls that help the user correct the final entry stay in the core flow.
Settings	The initial plan had a larger profile/preferences area.	The mockup keeps goal, appearance, account, data, About, and sign out.	The screen is reduced to settings that the final app actually needs.
